

Mounting more than 1 Sensor Pad on a single tile or faceplate.

If your tile or faceplate is relatively thin (up to 5mm thick) a spacing of 3 x the width of the Sensor Pad should be sufficient (fig 1); over that, because the sensing field fans out within the faceplate you may get “cross-talk” (fig 2) so you may have to position them further apart.

If it is not possible to position the Sensor Pads further apart, one possible solution is to lay an EARTH wire on the back surface of the tile, mid-way between the Sensor Pads. (fig 3)
